# Kota Urushigaki

Osaka, Japan | k.urushigaki@ist.osaka-u.ac.jp | github.com/kota5140 | linkedin.com/in/kotaursgk

*Security researcher in secure messaging protocols. Seeking summer 2027 research internships in applied cryptography and protocol security.*

## EDUCATION

**The University of Osaka** Apr 2027 – Mar 2029 (expected)
*Master's in Information Science, Graduate School of Information Science and Technology*

**The University of Osaka** Apr 2022 – Mar 2026
*B.Eng. in Computer Science, School of Engineering Science · Isobe Laboratory*

- **Σ Global Leader Award of Engineering Science** (Mar 2026)

**Technical University of Munich** Oct 2024 – Aug 2025
*Exchange student, Informatics*

## PUBLICATIONS

[1] **K. Urushigaki**, H. Kimura, A. Tanaka, T. Isobe. "Practical Attacks on a Decentralized Secure Messenger Session." *USENIX WOOT Conference on Offensive Technologies (WOOT '26)*, Baltimore, Aug 2026. First author and presenter. USENIX Artifact Available badge. Paper · Artifact

[2] **K. Urushigaki**, et al. "Impersonation Attack on the Anonymous Messenger App Session" (in Japanese). *Symposium on Cryptography and Information Security (SCIS 2026)*, Jan 2026.

## RESEARCH AND EXPERIENCE

**Specially Appointed Researcher, Isobe Laboratory, The University of Osaka** Apr 2026 – Present

- Analyze deployed cryptographic protocols, combining formal modeling with black-box and white-box analysis of real implementations to find design flaws.
- Preparing master's research on reverse engineering proprietary, undocumented cryptographic protocols and modeling them in Tamarin.

**Undergraduate Research: Security Analysis of the Session Messenger** Oct 2025 – Mar 2026

- Analyzed Session Protocol V1, used by a decentralized end-to-end encrypted messenger with millions of downloads and previously audited by Quarkslab, working from its shipped implementation.
- Found two design flaws: no mutual public-key authentication, and no cryptographic binding of messages to monotonic counters.
- Built three new practical attacks for a malicious storage node or insider: impersonation, timestamp forgery, and message dropping and replay.
- Built a fully local, reproducible testbed: a Docker Compose network with honest and malicious storage nodes, three patched iOS clients, and a CLI that drives each attack.
- Responsibly disclosed all attacks; the Session team acknowledged every reported issue.

**Cloud Security Engineer (part-time), Novagrid Co., Ltd.** Apr 2026 – Present

- Sole engineer responsible for operating and hardening multi-cloud infrastructure on Microsoft Azure and Google Cloud for a startup of about 50 people.

## AWARDS AND PROGRAMS

**Bronze Prize, Robust Democracy main track, ETHTokyo 2024 Hackathon** Aug 2024

- ZK Treasure Hunt: a multiplayer game in which a prover answers guesses with zero-knowledge proofs, so the treasure's location is never revealed.

**PSE Core Program Japan, Ethereum Foundation (Privacy & Scaling Explorations)** Apr – Aug 2024

- Training in zero-knowledge proof systems, circuit development, and applied cryptography.

**KEYENCE Foundation Scholarship** Aug 2023 – Present

## SKILLS

**Security:** cryptographic protocol analysis, cryptanalysis, end-to-end encrypted messaging, zero-knowledge proofs
**Tools:** Tamarin prover, Frida, Wireshark, Docker
**Programming:** Python, C, Rust, JavaScript
**Cloud:** Microsoft Azure, Google Cloud
**Languages:** Japanese (native), English (professional working proficiency, EF SET C1), German (elementary)
